

SIT223- Professional Practice In Information Technology

Task 7.1G Sprint Planning in Trello

1. Project summary document:

a. Provide a brief summary of the project (less than 400 words) that captures your understanding of the project, what it is, and what it intends to do.

One of the largest safety recalls in recent history is the Takata airbag recall, in which airbags produced by Takata from 2002-2015 were faulty, with the potential to deploy explosively, injuring or even killing car occupants. Due to the large period in which these faulty products were installed anyone could be at risk. It is therefore important that anyone potentially affected by this recall can quickly and easily check to verify whether their vehicle has been affected so that they can act as soon as possible.

CheckYourCar aims to facilitate this process by enabling car owners to check whether their vehicle has been affected by either the Takata airbag recall, or any other recall or safety concern. We will provide a web-portal where car owners can create accounts, input their cars make and model via form, which will then be compared against a database to see if it has been affected by any recall of known issues. Additionally, it will be able to alert customers who have already provided their information if a new recall or concern pertains to their vehicle.

Within this website, car owners can register an account and their make and model of their car. Users will be notified via email and a text message to their phones, when a new recall or issue is added from the database. The website will consist of a button to sign up and register a car and if present, a detailed list of issues or recall.

b. List group members and the mark they are targeting on OnTrack for this unit.
